Intel Data Center

INTRODUCTION: Intel, the semiconductor manufacturing powerhouse, is planning on building a new data center. Energy availability and usage are some of the key considerations in deciding on a location of the data center. For example, which regions produce a surplus of energy, and are therefore more likely to provide energy at cheaper prices? Which regions rely more on renewable energy sources?

In this project, co-designed with Intel's Sustainability Team, you'll write SQL queries that will power your analysis and create visualizations that will help the Intel team select the best location for the new data center.

HOW IT WORKS: Follow the prompts in the questions below to investigate your data. Post your answers in the provided boxes: the **yellow boxes** for the queries you write, **purple boxes** for visualizations and **blue boxes** for text-based answers. When you're done, export your document as a pdf file and submit it on the Milestone page – see instructions for creating a PDF at the end of the Milestone.

RESOURCES: If you need hints on the Milestone or are feeling stuck, there are multiple ways of getting help. Attend Drop-In Hours to work on these problems with your peers, or reach out to the HelpHub if you have questions. Good luck!

SQL App: Here's that link to our specialized SQL app, where you'll write your SQL queries and interact with the data.

— Data Set **Descriptions**

In this project you'll query 3 datasets as well as write a query to generate a new dataset that you will use in your tableau visualizations. The `intel.energy_data` dataset will be the main dataset you'll be working with. The `intel.energy_by_plant` and `intel.power_plants` datasets will be joined for an in-depth analysis of energy production at the power plant level.

Read below to learn more about the datasets and their features.

`intel.energy_data`: Contains information about daily energy production and consumption for different regions in the United States.

- `balancing_authority` – A Balancing Authority is responsible for maintaining the electricity balance within its region. This is a company that makes sure electricity is being exchanged between electric providers and regions so that no region runs out of electricity due to high demand.
- `date` – The date the energy was produced.
- `region` – The electric service area within a geographic area of the USA. e.g. California, Midwest, etc.
- `time_at_end_of_hour` – The time and date after energy was generated, .e.g., energy generated between 1pm-2pm will show up as 2pm in this field.
- `demand` – The energy demand in megawatts (MW) on the grid (what the houses/business are using).
- `net_generation` – The energy produced in MW in the region by all sources e.g., wind, coal, nuclear, etc.
- `all_petroleum_products` – The energy produced in MW by petroleum products.
- `coal` – The energy produced in MW by all coal products
- `hydropower_and_pumped_storage` – The energy produced in MW by water power and pumped heat sources.
- `natural_gas` – The energy produced in MW by natural gas sources
- `nuclear` – The energy produced in MW from nuclear fuel sources
- `solar` – The energy produced in MW by solar panels and other solar energy capturing methods.
- `wind` – The energy produced in MW from wind turbines and other wind sources.

`intel.power_plants`: Contains general information about power plants in the United States.

- `plant_name` – The name of the power plant.
- `plant_code` – The unique identifier of the plant.
- `region` – The region in the US where the power plant is located. Matches the regions in the intel.energy_data
- `state` – The state where the power plant is located.
- `primary_technology` – The primary technology used to generate electricity at the power plant.

`intel.energy_by_plant`: Contains total energy production information at the plant for the year 2022.

- `plant_name` – The name of the power plant.
- `plant_code` – The unique identifier of the plant.
- `energy_type` – The kind of energy generated by the power plant. Either renewable energy or fossil fuel.
- `energy_generated_mw` – The total energy generated, in MegaWatts, at the plant for the year 2022.

— Task 1: Energy Generation

Let's first identify regions that are net energy producers. Not all regions generate enough energy to meet the local demand. Some regions purchase power from other regions, while others sell their surplus to regions in need.

A. Write a query using the `intel.energy_data` table that calculates the sum total of energy produced, grouped by each region. Sort the output by highest total energy. Which region has the highest positive total energy?

HINT: Total energy is equal to the difference between `net_generation` and `demand`.

```
SELECT
    region,
```

```
   SUM(net_generation - demand) AS Region_Sum
FROM
   intel.energy_data
GROUP BY
   region
ORDER BY
   Region_Sum DESC
```

The mid-atlantic has the highest positive energy with a total of 31693087 megawatts.

B. Intel is interested in regions that generate a large amount of energy from renewable sources. Renewable energy is defined as any energy generated from hydropower_and_pumped_storage, wind, and solar sources.

Write a query that calculates the sum total of renewable energy by region. Sort the output by the region with the highest renewable energy. What are the top two regions for total renewable energy production?

HINT: You need to add the 3 energy sources together in one line before doing your group by: `SUM(col1 + col2 + col3) AS new_column`

```
SELECT
   region,
   SUM(hydropower_and_pumped_storage + wind + solar) AS
Region_Total
FROM
   intel.energy_data
GROUP BY
   region
ORDER BY
```

```
    Region_Total DESC
```

The top two regions for total renewable energy production are the northwest and Texas, Northwest has a total energy production of 199266574 megawatts, while Texas has a total energy output of 131367234 megawatts.

C. Modify your query slightly so that it calculates the **percentage** of renewable energy by region.

HINT: Divide the amount of renewable energy by the sum total of `net_generation`, and then multiply the result by 100.

```
SELECT
    region,
    (SUM(hydropower_and_pumped_storage + wind +
solar)/SUM(net_generation) * 100) AS Region_Total
FROM
    intel.energy_data
GROUP BY
    region
ORDER BY
    Region_Total DESC
```

D. Which regions change from the top 3 when looking at total renewable energy vs percentage of renewable energy?

The regions that changed from top 3 when looking at total renewable energy was Northwest, Texas, and central vs the top 3 percent of renewable energy are Northwest, Central, and

California. Given this information only Central and California changed while Northwest remained at the top.

— Task 2: Generating New Data by Energy Type

Intel would like to know how renewable energy and fossil fuels trend over time. In order to do this, you will first need to generate a new table using your SQL knowledge and the `intel.energy_data` table before visualizing trends in Tableau Cloud.

A. Write a query that calculates the renewable energy generated for each row. Return only the `date`, `region`, and `energy_generated_mw` columns.

Note: `energy_generated_mw` is the alias for `hydropower_and_pumped_storage + wind + solar`.

```
SELECT
    date,
    region,
    (hydropower_and_pumped_storage + wind + solar) AS
energy_generated_mw
FROM
    intel.energy_data
ORDER BY
    region,
    date
```

After showing the result of the query to your manager, she tells you that she wants it to be clear that the `energy_generated_mw` column is referring to renewable energy types. She asks you to create a new column called `energy_type` that has the value 'renewable energy' for each row.

A colleague teaches you a simple method to do this. When writing your query, add an additional column after your select statement. Here is an example:

```
SELECT
   *, -- any relevant fields to the query
   'renewable energy' AS energy_type
FROM intel.energy_data
```

B. Modify your query from Part **A.** to include the `energy_type` column.

```
SELECT
   date,
   region,
   (hydropower_and_pumped_storage + wind + solar) AS
energy_generated_mw,
   'renewable energy' AS energy_type
FROM
   intel.energy_data
```

C. Next, write a **new** query that calculates the fossil fuel energy generated for each row. As in Part **A.**, return only the `date`, `region`, and `energy_generated_mw` columns, where `energy_generated_mw` is now the alias for `all_petroleum_products + coal + natural_gas + nuclear + other_fuel_sources`.

```
SELECT
   date,
   region,
   (
      all_petroleum_products + coal + natural_gas + nuclear +
other_fuel_sources
   ) AS energy_generated_mw
FROM
   intel.energy_data
```

```
ORDER BY
    region,
    date
```

D. Modify your query in Part **C.** to include the `energy_type` column. This column should have the value 'fossil fuel' for each row.

HINT: This is very similar to Part **B.**!

```
SELECT
    date,
    region,
    (
       all_petroleum_products + coal + natural_gas + nuclear +
    other_fuel_sources
    ) AS energy_generated_mw,
    'fossil fuel' AS energy_data
FROM
    intel.energy_data
ORDER BY
    region,
    date
```

E. Your queries from Parts **B.** and **D.** should both have the columns `date`, `region`, `energy_generated`, and `energy_type`. Write one final query that `UNION`s these two together.

```
SELECT
    date,
    region,
    (hydropower_and_pumped_storage + wind + solar) AS
energy_generated_mw,
    'renewable energy' AS energy_type
FROM
```

```
    intel.energy_data

UNION

SELECT
    date,
    region,
    (
        all_petroleum_products + coal + natural_gas + nuclear +
other_fuel_sources
    ) AS energy_generated_mw,
    'fossil fuel' AS energy_data
FROM
    intel.energy_data
ORDER BY
    region,
    date
```

Task 3: Aggregating Power Plant Data

Intel has provided you with additional data in order to reach the best conclusion about the location of its next data center. In this task you will be working with two tables `intel.power_plants` and `intel.energy_by_power_plant`. You will need to join these tables before you can aggregate them to help the Intel team with their analysis.

A. Join the `intel.power_plants` and `intel.energy_by_power_plant` data on the `plant_code`. This joined table will form the basis for the rest of the task.

If done correctly, your output will have 2,504 rows.

```
SELECT
    *
FROM
```

```
   intel.power_plants
   JOIN intel.energy_by_plant ON intel.power_plants.plant_code
= intel.energy_by_plant.plant_code
```

Note: It is recommended to use the `WITH` keyword for the remainder of this Task to simplify your queries. For a refresher, rewatch " 🍿 The `WITH` Keyword" in SkillBuilder 6.

B. Write a query that returns the total number of **renewable energy** power plants for each region. Which region has the most renewable power plants?

```
WITH epp AS(
SELECT
   region AS location,
   A.*
FROM
   intel.power_plants P
   INNER JOIN intel.energy_by_plant A ON P.plant_code =
A.plant_code

   )
SELECT
   region AS Location,
   COUNT(*) AS total
FROM
   epp
   INNER JOIN intel.energy_data ed ON ed.region = epp.location
WHERE
   epp.energy_type = 'renewable_energy'
GROUP BY
region
ORDER BY
total DESC
```

The region that has the largest number of renewable energy is the northwest with 34032600 (MW).

C. Next, write a query that returns both the total number of power plants and the total energy generated, specifically from plants that use "Solar Photovoltaic" technology, grouped by each region.

```sql
WITH epp AS(
SELECT
  region AS location,
  p.primary_technology AS ptech,
  p.plant_code AS pcode,
  A.energy_generated_mw AS eg
FROM
  intel.power_plants P
  INNER JOIN intel.energy_by_plant A ON P.plant_code =
A.plant_code

  )
SELECT
  region AS Location,
  COUNT(epp.pcode) AS total_pp,
  SUM(epp.eg) AS total_eg_mw
FROM
  epp
  INNER JOIN intel.energy_data ed ON ed.region = epp.location
WHERE
  epp.ptech = 'Solar Photovoltaic'
GROUP BY
region
ORDER BY
total_pp DESC
```

D. Modify your query in part **C** to <mark>only show regions having at least 50 power</mark> plants that use "Solar Photovoltaic" technology. What can you infer about the efficiency (or size) of the power plants in the Midwest region relative to the other regions in your output?

```sql
WITH epp AS(
   SELECT
      region AS location,
      p.primary_technology AS ptech,
      p.plant_code AS pcode,
      A.energy_generated_mw AS eg
   FROM
      intel.power_plants P
      INNER JOIN intel.energy_by_plant A ON P.plant_code =
A.plant_code
   )
SELECT
   region AS Location,
   COUNT(epp.pcode) AS total_pp,
   SUM(epp.eg) AS total_eg_mw
FROM
   epp
   INNER JOIN intel.energy_data ed ON ed.region = epp.location
WHERE
   epp.ptech = 'Solar Photovoltaic'
GROUP BY
   region
HAVING
   COUNT(epp.pcode) >= 50
ORDER BY
   total_pp DESC
```

Based on the information provided by my code, we can infer that the efficiency (or size) of the power plants in the Midwest region have a higher output of 157578470855 compared to all the other regions, such as texas with 152645312640. This could be caused by a lack of power plants that use Solar Photovoltaic energy. Another reason as to why could be the demand of energy in some of these regions.

Note: There is more Tableau work up ahead! If you want to skip the LevelUp jump straight to **Task 4** below!

— LevelUp: Hourly Trends in Renewable Energy

Before moving on to your Tableau Visualizations, let's investigate how renewable energy generation fluctuates with the time of day.

A. Write a query that calculates the total **renewable** energy generated in each region for each hour of the day.

HINT: You'll need to use the `date_part` function to get the hour from the `time_at_end_of_hour` column. Your result should only have the values 0–23 for that new column.

```
(paste your query here)
```

B. Modify your query to filter to the 'California' and 'Northwest' regions only.

```
(paste your query here)
```

C. Use the built-in visualizer in the SQL app to plot a line graph of the energy generated for each hour of the day and colored by the region. If done correctly you should have two lines in your visualization.

> (paste your visualization here)

D. What can you say about the renewable energy generation between California (CAL) and the Pacific Northwest (NW)?

> (write your answer here)

— Task 4: Visualizing and Analyzing Using Tableau

Phew! Now that you've gotten the queries out of the way, you're ready to dive into investigating the best regions for Intel to put its next data center. The remaining Tasks will be completed in Tableau, and will focus on visualizing and analyzing your results. **Click this link to navigate to the workbook you'll use to complete the remainder of this Project.**

Once you've published your Tableau Workbook, paste the Share Link in the box below.

Note: Your share link <u>must</u> begin with:
```
https://prod-useast-b.online.tableau.com/#/site/globaltech/workbooks/...
```

> https://prod-useast-b.online.tableau.com/#/site/globaltech/workbooks/2112450?:origin=card_share_link

Continue to post your answers in the provided boxes: purple boxes for your visualizations, and blue boxes for text-based answers.

A. On the "Net Production" sheet, create a bar chart of ==net production== , by region. Sort the chart in *descending* order, from tallest to smallest.

The net energy produced is calculated by subtracting the total energy demand from the total energy generation. This is already created in the field called `Net Production`.
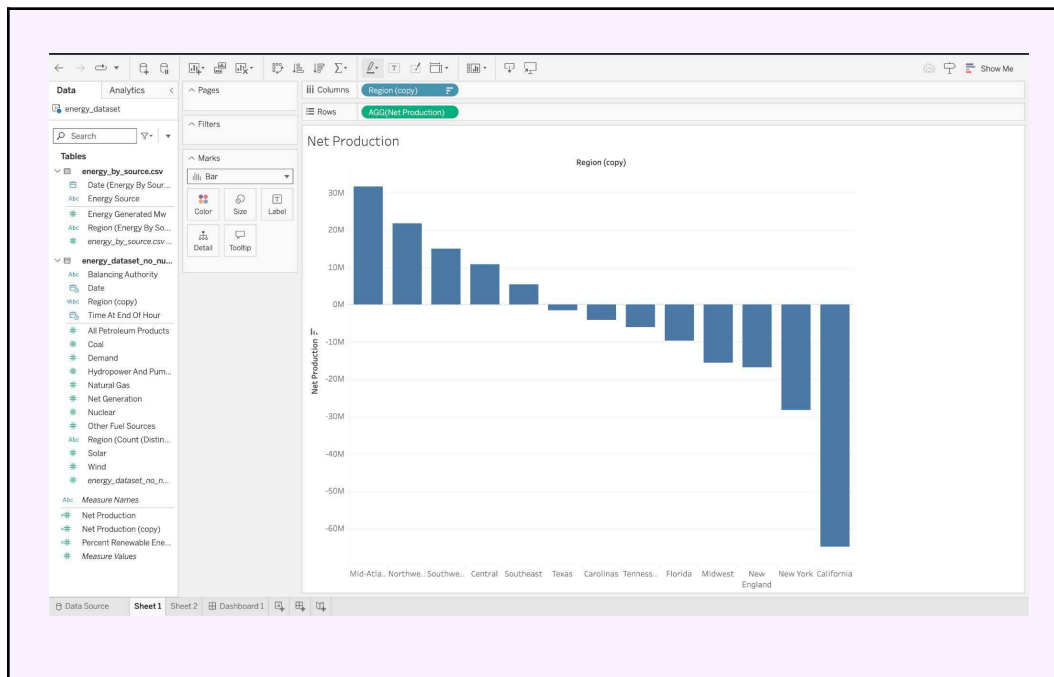

B. Next, on the "Renewable Energy" sheet, create a bar chart illustrating which regions generate the greatest percentage of renewable energy.

**HINT:** In Tableau, you have a field called `Percent Renewable Energy` .

Create a bar chart in descending order of regions with the most renewable energy percentage.
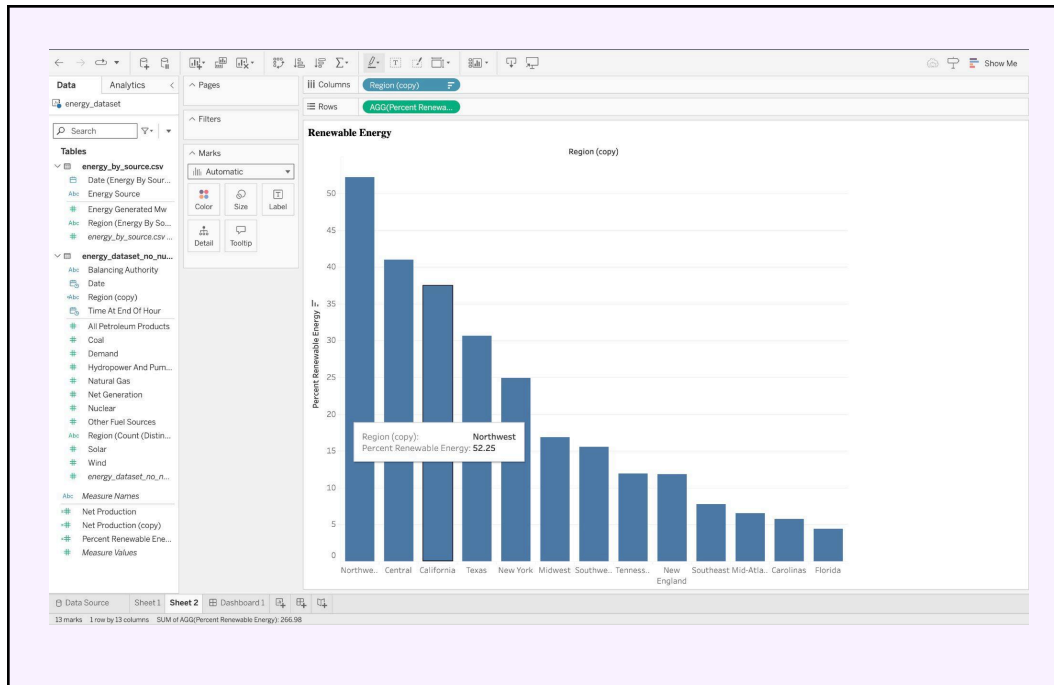

C. On the "Energy Source by Region" sheet, create a line chart of the energy generated for each energy source (fossil fuels & renewable energy) at the weekly date level. Add a filter for the region to your chart.

For this chart, you will use the `energy_by_source` dataset loaded into your Tableau workbook.
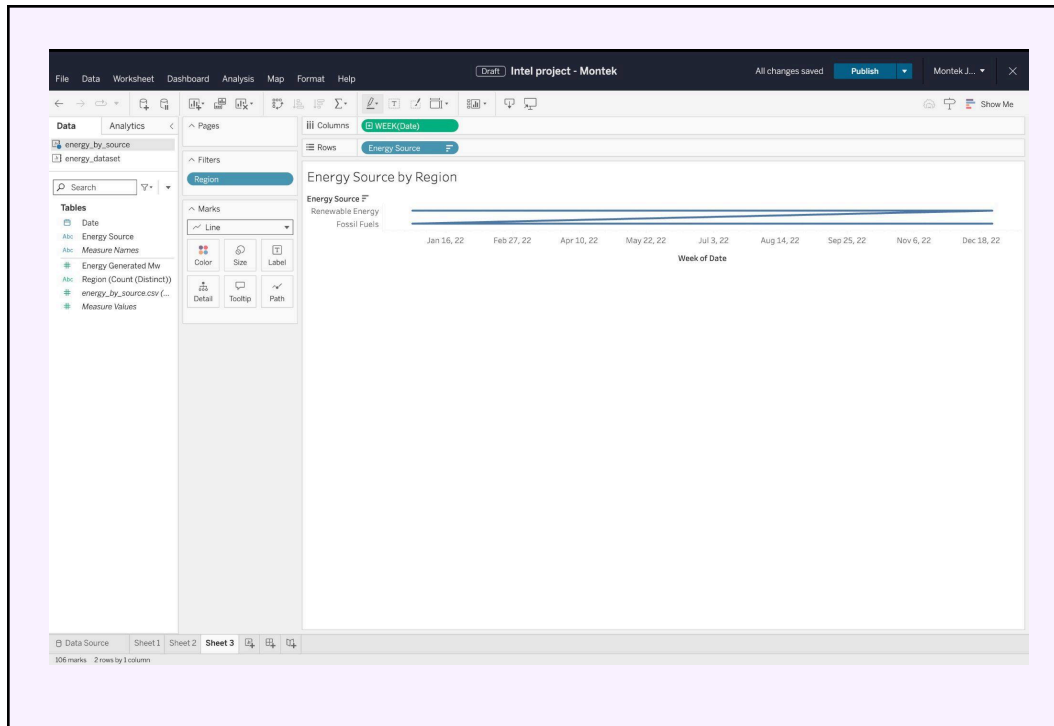

D. On the "Energy by State" sheet create a bar chart of the <mark>total energy generated by each state and energy type</mark>. Color the bars by energy type. Include a <mark>region filter in your chart to reduce the amount of bars shown</mark>.

For this chart you will use the `power_plant_energy` dataset that you created. You can select the data source in the upper left hand column in Tableau.
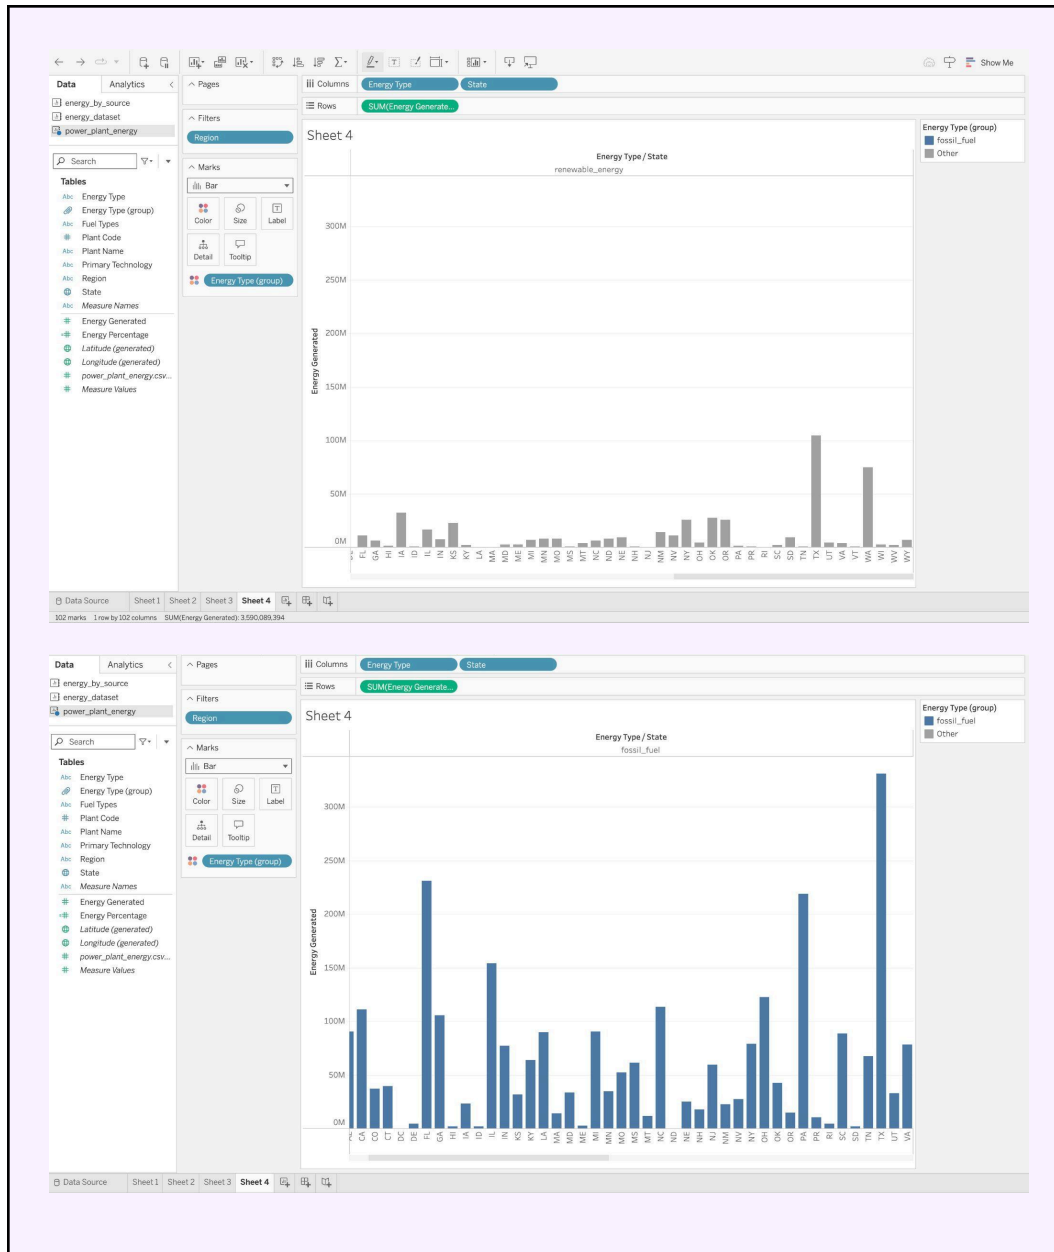

— **Task 5:** Communicating Results

Your manager wants you to share the visualizations you created in Task 3 with the Sustainability team for visibility. She has created a dashboard with your visualizations (see the "Dashboard" sheet in Tableau) and has asked you to write a short paragraph explaining which region you recommend that the next data center be built.

A. In 1–2 paragraphs, summarize what can be gleaned from your visualizations. What **region** and **state** do you think is best and why?

> Based on my visualizations, it can be determined that states Texas and Florida are the largest users of fossil fuel and renewable energy sources. Despite this they rely heavily more on fossil fuel, this could be due to a lack of incentives for solar energy and power plants, most likely due to the return in investment not being there. Given that electrical energy and environmental energy are more expensive.
>
> With regards to the regions, the midwestern is the largest region where there's a high percentage of net production for renewable energy. With Texas being ranked below with a net production of around -1 million dollars, this may play a role as to why texas doesn't invest in renewable energy sources.

That's it! Submit your final project for evaluation, and go celebrate your achievement! You just completed a rich, complex data analysis project representing real-world level work. You've gained some impressive skills! Well done, and never stop learning 😀

— Submission

Great work completing your Portfolio Project!! To submit your completed project file, you will need to download / export this document as a PDF and then upload it to the Milestone submission page. You can find the option to download as a PDF from the File menu in the upper-left corner of the Google Doc interface. Triple check the link to your Tableau workbook.

— Evaluation Rubric

Unlike your Milestones that were evaluated largely based on your effort, the evaluation of your Portfolio Project will follow traditional evaluation methods, with tasks assessed for correctness and assigned point values accordingly.

Partial credit will be given where parts of this task are correct, even if other parts are incorrect or incomplete.

Task	Task title	Max points
1	Energy Generation	50
2	Generating a New Table by Energy Type	55
3	Aggregating Power Plant Data	35
4	Visualizing Using Tableau	40
5	Communicating Results	20
	TOTAL POINTS:	200
	LevelUp	
1	Hourly Trends in Renewable Energy	20
